In the Specification

In the specification, please replace the paragraph, beginning on Page 22 – Line 18 and ending on Page 22 – Line 22, with the following:

--Referring again to **Fig. 5**, the CliFormat class **502** is a class associated with the CliAlias class **500** within the command schema **404**. Lines between the classes indicate this association.--

In the specification, please replace the paragraph, beginning on Page 24 – Line 6 and ending on Page 24 – Line 19, with the following:

--Another class associated with the CliAlias class **500** is the CliVerb class **506**. An instance of the CliVerb class **506** defines the verb or behavior associated with an alias (i.e., a CliAlias class **500** instance). An instance of the CliVerb class **506** has a "Name" string. The Name string defines the actual function to be invoked when the verb is used in the alias command. The function may be from a fixed list of system-defined standard functions including CALL, SET, LIST, GET, and ASSOCIATE, or it may be a verb that is implemented by the invocation of a method on the target system **204** object defined by the alias or an invocation of a command line utility. Each instance of the CliVerb class **506** has a "Standard" Boolean which indicates whether the verb is a standard verb or a method invoked on the target object. In addition, each instance provides a "Derivation" string which represents the name of the standard verb or the name of the method from the target object on which the verb is based or the text required for the invocation of a command line utility.--
